

TANAT LOKEJAROENLARB

STAFF SRE & PLATFORM ENGINEER @ADEVINTA | SPEAKER • BLOGGER

I have a deep experience designing, operating, and evolving large-scale Kubernetes platforms serving Europe's largest digital marketplaces.

I operate and scale multi-tenant Kubernetes platforms (30+ clusters, 3,000+ nodes, 100K+ pods, 300K RPS, billions of daily requests) with a strong focus on reliability, cost efficiency, developer experience, and long-term sustainability.

IMPACTED HIGHLIGHTS

- Led 300+ production incidents, driving blameless postmortems and systemic fixes
- Reduced cloud spend by $\approx$ €250K/month via cost observability and optimisation
- Reduced on-call paging by >90% through automation and alerting redesign
- Built Kubernetes operators and self-healing systems to eliminate operational toil
- Influenced platform architecture and reliability standards across dozens of teams

CONTACTS

Barcelona, Spain

SKILLS

Core:

Kubernetes

Site Reliability Engineering

Platform Engineering

Cloud & Infrastructure:

Aws | Terraform | Argocd

Programming:

Golang

Reliability & Operations

Slo / Sli | Grafana Cloud

Incident/on-call Management

Kubernetes Operator

Finops

EXPERIENCE

Staff Site Reliability Engineer

Adevinta, Barcelona, Spain | March 2024 - Present

- Designed and evolved a cluster fleet management model, treating Kubernetes clusters as declarative, self-validating entities rather than snowflakes

- Built and operated custom Kubernetes operators acting as a control plane for cluster lifecycle, maintenance, and rollout orchestration

- Implemented progressive, SLO-gated cluster rollouts, using reliability signals and blackbox tests to ensure safety before advancing changes across the fleet

- Established platform-level reliability standards, including SLO/SLI definitions, alerting principles, and incident response expectations adopted across teams

- Designed instance management and reliability strategies that make maintenance automated, repeatable, and low-effort, significantly reducing manual intervention and operational risk

- Partnered with technical leadership to influence platform architecture, networking models, and operational strategy, balancing reliability, cost efficiency, and developer experience

Senior Devops Engineer

Adevinta, Barcelona, Spain | March 2023 - March 2024

- Established and operationalised SLOs and SLIs for critical platform services, enabling objective reliability discussions and prioritisation

- Redesigned alerting and response workflows to shift from reactive paging to signal-driven operations

- Introduced self-healing mechanisms and automation to eliminate common failure modes and reduce operational noise

- Led the evolution of Kubernetes upgrade strategy, transitioning from Blue/Green to in-place EKS upgrades to simplify fleet operations

- Worked hands-on across Kubernetes, observability, and platform tooling to improve reliability, scalability, and cost efficiency at platform scale

Devops Engineer

Adevinta, Barcelona, Spain | October 2021 -March 2023

- Operated and supported production Kubernetes clusters as part of a shared internal platform
- Defined reliability expectations (SLOs) for common platform services such as ingress, certificates, logging, and monitoring
- Built Kubernetes operators and automation to improve onboarding and reduce operational friction for platform users
- Integrated IAM, autoscaling, logging, and monitoring capabilities to accelerate teams from development to production

Devops Manager / Platform Infrastructure Owner

Monix – Bangkok, Thailand | March 2021 – October 2021

- Designed and operated AWS-based infrastructure, including production-grade EKS, networking, and security foundations
- Built an internal developer platform covering CI/CD pipelines, identity management, secrets, and certificate automation
- Operated and maintained stateful production systems including Kafka and MongoDB
- Established cloud cost governance practices and introduced CNCF-aligned tooling such as GitOps, Kubernetes Operators, and Vault

Software / Platform Engineer

Exxonmobil – Thailand & Global | June 2016 – November 2020

- Led platform and DevOps enablement efforts for globally distributed engineering teams
- Designed Kubernetes-based platforms on Azure and OpenShift
- Defined Infrastructure-as-Code and CI/CD standards adopted across multiple teams
- Designed event-driven microservices architectures using Kafka and Redis
- Provided architecture guidance, reference implementations, and best practices to accelerate product delivery

EDUCATION

Bachelor of Science (BSc), Computer Science

King Mongkut's Institute of Technology Ladkrabang, Bangkok
2012-2015

GPA: 3.87 - First-class honored, gold medal.
